

CARING FOR YOUR

SEEDS

Care

(The Basics)

- **Watering:** Keep soil damp not wet, wet soil attracts disease
- **Environment:** Lots of Sunlight and safe from pets
- **Sunlight:** Rotate your seedling every few days so your seedling doesn't start to lean
- **Space:** Plants doesn't like to be overcrowded so thin to smaller seedlings to make room

Hardening Off

(Transitioning seedlings outdoors)

- Check the weather and last frost date for our area
- Start a few weeks before you plan to transplant
- Set seedlings in a protected spot outdoors for a few hours each day and bring them in at night

Transplanting

(Pot to ground)

1. Prep your area: water, loosen soil, and add compost
2. Dig a hole bigger than your seedlings roots
3. Plant seedlings at the same depth as the pot it was in
4. Fill in soil around the roots
5. Gently press soil around seedling for good root to soil contract
6. Water immediately after transplanting and add mulch around your seedling (ex-woodchips, leaves, grass clippings, hay)
